Schultz paper

MWR 1999

→ not all banded structure due to CSI!

regular cond. upright instability?
coexistence?

"ingredients-based" methodology (ugh)

need { CSI nec redx
moisture
lift

NWP output?

CSI & front related — need lift
frontogenesis when stability weak
enhanced circ.!

heat flux

triggered vs. stat. eq.
buildup release ~same rate
(no "cap"?)

→ precip falls vertically
→ p'
~~forced~~ slantwise ascent, but stable

continuum CI & CSI?

"upscale development" CI first → CSI
then grow stability

"downscale development" ~~front~~ ascent → CSI →
latent heat release → CI
destab.

|W|>? for charge separation
ice & water?
vert shear?
